Description

The **Pro.MAF** is our flagship mass air meter. It outflows larger diameter meters by a long shot, due to its bell mouth design, and because the sampling element does not protrude into the opening.

The patented 360 sampling design of the **PRO.MAF** makes this meter the finest in the industry. No other meter provides a signal as clean as this. It is, by far, *the most accurate meter on the market*. Don't settle for the copy produced by the other guys! It does not have 360 degree sampling. The 360 degree sampling allows it to "average" the air flowing through meter, resulting in a more accurate reading than any other meter available.

It is capable of supporting 800 flywheel HP. A high flow conical air filter is included.

Pro.MAF does not have integrated IAT capabilities, plan for this on your application
